

IdP as a service

Future-proof your identity management with IdP as a service

Identity issuer

(IdP) as a service

Our IdP service offers a secure and reliable solution for identity management, based on our solid experience in secure operation and management of encryption keys.

The service is designed to provide improved levels of trust and supports all Digg-approved e-credentials, making it more robust than traditional IdP solutions.

Our service is specifically developed to meet industry challenges and address common shortcomings found in many existing IdP solutions. Here are some of the key features our solution includes:

- ▶ **Support for Holder of Key:** Requirements to meet trust level 4 according to Digg.
- ▶ **Hardware Security Module (HSM) support:** Enhanced security of the encryption keys in accordance with Sweden Connect's requirements.
- ▶ **Integration with APIs for e-credentials:** Ensures compatibility and efficiency across platforms

The solution is more powerful than basic IdP services from well-known providers such as Google and Microsoft (ADFS) through its ability to seamlessly integrate with all approved e-credentials and meets the requirements for the highest level of trust according to Digg's framework.

Specially packaged for

digital national exams (DNP)

Our offer is specially adapted to facilitate the implementation of digital national exams (DNP) by offering a simple and secure process for all school principals. With our service, your organization can effectively address the challenges associated with the IdP requirements of DNP, including trust level signaling and support for e-authentication. We support all e-credentials approved by Digg, in accordance with the requirements of Digg and the National Board of Education. The service can be used for both teaching staff and students who do not need to be in the same environment.

Our modern and customizable authentication technology provides a user-friendly experience and enables seamless integration. The service is optimized to not only support digital proofs but also broaden the authentication needs within your organization.

About us

Complior AB, a leading Nordic supplier of IT security solutions and private cloud services, supports organizations in protecting sensitive data and meeting standards and legal frameworks such as ISO 27001, PCI-DSS, GDPR, NIS2, etc.

We offer infrastructure and operation services with a well-developed method to provide secure operation in our data centers in Sweden.

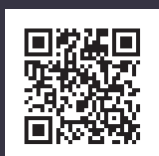

Fortified ID develops modern products for strong authentication and identity management that are adapted to the new requirements that our customers face today.

Our solutions are built with modern operations in mind, adapted for Dev-ops. It should be easy to manage, automate, update and monitor our products regardless of the size of the implementation.
